

Photosynthesis is the process by which plants make their own food using sunlight. Chlorophyll is the green pigment found in leaves that absorbs sunlight. Plants take in carbon dioxide from the air through tiny pores called stomata. Water is absorbed by the roots and travels up through the stem to the leaves. Oxygen is released as a byproduct of photosynthesis into the atmosphere. The mitochondria is known as the powerhouse of the cell. DNA carries the genetic information of all living organisms. The nucleus controls all the activities of the cell. Proteins are made up of amino acids and are essential for body functions. Enzymes are biological catalysts that speed up chemical reactions in the body. The human body has 206 bones that form the skeletal system. The heart pumps blood throughout the body through blood vessels.
